

Output Window

□The **Output Window** displays different content depending on which search mode is active.

If the **Find files** mode is active, right-clicking in the Output Window displays a context menu with the following options:

Copy to clipboard	copies the current content to the clipboard
Copy selected line to clipboard	copies the selected line to the clipboard
Clear output	clears content of Output Window
Open results in UltraEdit (new file)	opens search results in UltraEdit as a new file
Open selected in UltraEdit	opens file referenced in currently selected line in UltraEdit
Load in UltraCompare (first frame)	loads file referenced in currently selected line in UltraCompare
Open in default application	opens file referenced in currently selected line in default application

In **Find duplicates** mode, the **Output Window** displays a listing of the groups of duplicates. This displays the name of the group and the number of duplicates in the group. This is shown as the group name followed by a number in parentheses - for example, "Test.txt(4)" . If **Name** is used as a search criterion, the name of the group will be the name of the file. So if a search finds that for "test.txt" there are four other copies, for "abc.txt" there are ten other copies and for "screenshot.png" there are three copies, the following entries would appear: "test.txt (4)", "abc.txt (10)" and "screenshot.png (3)".

If **Name** is not in use and **Size** is used, then the size will become the name of the groups and the tag <Size> will appear before the group name to clarify against what criteria the group was named. If there are three files that are 102 kb and two files with 1.0 MB the following entries would appear: <Size> 102 kb (3) and <Size> 1.0 MB (2).

If only **Content** was used as a search criterion then the groups will be given default names, for example <Content> Group1(#), <Content> Group2(#) etc.

When a search is run the files can be narrowed down by name first, size second, date third and then finally content. This is to reduce the search time by reducing the number of date and content compares. Selecting a group in this list will display the entries in the **Path** column in the Output Window.

In **Find duplicates** mode, the Output Window contains a list with entries for each duplicate file in the group. The data is displayed in columns. What columns are displayed can be changed under the context menu that appears when users right click on the column headers. Column widths can be altered through directly resizing the columns in the list control. The following columns may be displayed:

Path	contains the full path of the duplicate file
Size	shown in bytes, KB, MB, GB where applicable
Created	displays creation date for duplicate files
Modified	displays modified date for duplicate files
	An 8 character string is displayed to represent the attribute bit listing in the " - - a - - - -" style format. Format:
	1 - reserved
	2 - reserved
Permissions	3 a -> archive
	4 d -> subdirectory
	5 v -> volume label
	6 s -> system file
	7 h -> hidden
	8 r -> read only

When the **Find duplicates** mode is active, right-clicking in the Output Window displays a context menu with the following options:

File properties	opens the OS's File Properties dialog for the selected file
Open in default program	opens selected file in default program
Open containing folder	opens Explorer displaying the containing folder for the item selected
Open in UltraEdit	opens the file in UltraEdit
Load in UltraCompare	if two or three files are selected this option will be enabled. When executed it will start a new compare session to compare the files selected.
Select all	selects all items in current listing
Deselect all	deselects all items in current listing
Rename	initiates renaming of the selected file. Editing is done via the Name column in the list control. The new name is immediately applied to the file when done.
Send to Recycle Bin	moves selected files to Recycle Bin
Delete	deletes selected files from system
Delete all selected files except oldest	deletes all selected files except the oldest
Delete all selected files except newest	deletes all selected files except the newest

newest

deletes all selected files except the newest

Multiple files may be selected in the Duplicates Locations listing by using the mouse and CTRL or SHIFT keys. This allows users to apply context menu options to multiple files in the listing at the same time.
